

Star Multi-link

A quick and easy solution to Linking Multiple PDUs

Increases the number of PDUs controlled from one IP address

What is Multi-link

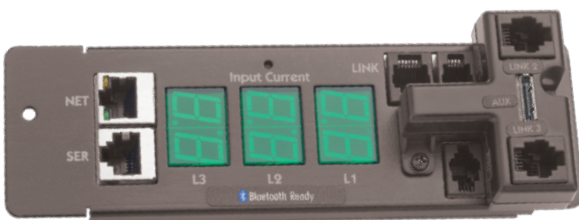

Server Technology's PRO2 product line introduces the Star Linking Technology that supports the optional linking of up to 3 expansion (link) units per one PRO master unit, allowing a single IP address for up to 4 PDUs, either a single cabinet for in multiple cabinets

- **Redundant Power and Communication**
The multi-link arrangement is fault tolerant, with redundant power coming from the first link unit
- **Outlet Grouping**
The multi-link arrangement allows outlet grouping across the master and the three link units.
- **Multi-Link Module (or Dongle)**
In the multi-link arrangement, the first PRO link units connects via the PRO link port. However the second and third link units attach to either a T-shaped module or to a dongle which connects to the AUX port on the master unit via a 12" (30cm) cable.

Module vs. Dongle

The module will only fit on 2.2" wide PRO2 products. The dongle can be installed on any PRO1 or PRO2 units.
